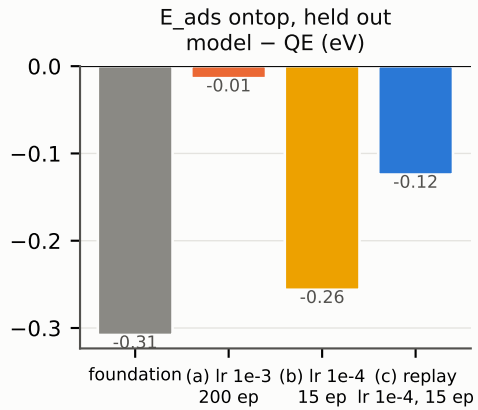
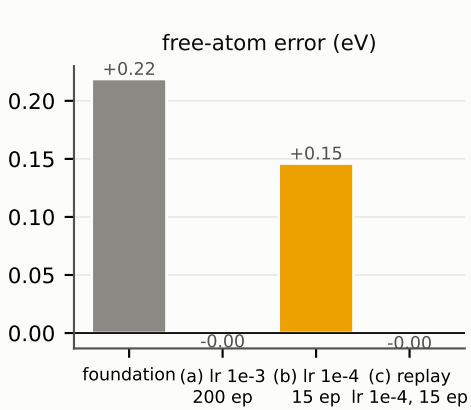
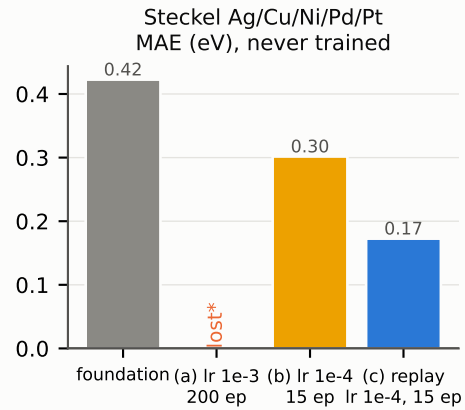
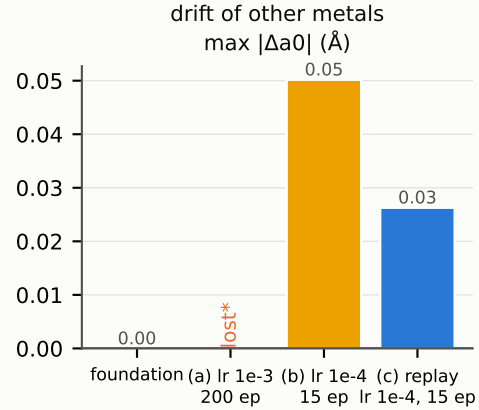
MACE-MP-0 fine-tuned on 84 QE frames + free Hg atom: learning rate vs replay (one seed, one split)









* lost: flat E(a) for Ag, Cu, Ni, Pd, Pt after (a). (c) replays 2000 random MPtrj structures; mace-torch also triplicated our data in (c) (real/replay ratio < 0.1), so (c) made more updates on it than (b).
